Title [MIV] Patch constellations<br>Source PUT, ETRI<br>Authors Adrian Dziembowski, Dawid Mieloch, Gwangsoon Lee, Jun Young Jeong

#### Abstract

The document presents a proposal of adding a third type of transmitted views, resulting in basic views, semi-basic views (additional views, but not split into clusters/patches, so a patch constellation with preserved relative arrangement is packed into an atlas), and typical additional views (packed as a mosaic of patches). Proposed approach decreases number of patches and increases temporal consistency of the video. The recommendation is to include the proposal into TMIV 17.

## 1 Proposal

We propose to modify a TMIV encoder (MIV Main anchor) by changing two steps: view labeling and patch packing. In TMIV 16, there are two types of views: basic and additional. By default, in TMIV 16 there are as many basic views (blue in Fig. 1B), as fit in the first atlas, while the second one contains patches from additional views (green and orange in Fig. 1B). In the proposal, we do not change the first atlas (Fig. 1A), but the second one is filled with proposed semi-basic views (as many as fit there, green in Fig. 1A). Semibasic views are partially-occupied (occupied areas in Fig. 1A - darker green). Patches from additional views (orange in Fig. 1A) are packed into non-occupied areas of semi-basic views (pale green, Fig. 1A).

Fig. 1. Atlases in the proposed approach and A65 anchor.
The decision regarding labeling the view as semi-basic or additional is performed based on the pruning graphs, and non-basic views which are higher in the graphs become semi-basic views.

## Example (B01):

info Pruning graph:
info ( v8 v19) <- V2 <- v12 <- V1 <- V23 <- v14 <- V7 <- V5 <- v21 <- v3 <- v18 <- v10 <
v17 <- v11 <- v16 <- v0 <- v22 <- v4 <- v20 <- v6 <- v13 <- v9 <- v15
info Inter period: [0, 32)
info Loading multiview frame 0 with start frame offset 0 (= 0).
info View types:
info ( B B ) $<\sqrt{S<-S}<-A<-A<-A<-A<-A<-A<-A<-A<-A<-A<-A<-A<-A<-A$
$<-A<-A<-A<-A<-A<-A$

Another example (JO1):
info Pruning graph:

info Inter period: [0, 32)
info Loading multiview frame 0 with start frame offset 0 (= 0 ).
info View types:

Proposed approach allows for:

- decreasing the total number of patches,
- increasing temporal consistency of the video, incl. transitions between consecutive GOPs (Fig. 2).

Limitations:

- the proposal preserves all small clusters of semi-basic views (which would be skipped during packing in TMIV16), so it requires to change the minimum block size for natural content: 128 -> 64,
- efficiency of the proposal depends on proper ordering of views in the pruning graphs (which is the case for almost all the content, except for LO2).

## 2 Results (A65)

## Mandatory content - Proposal vs. Low/High-bitrate Anchors

| Sequence |  | BD-rate <br> Y-PSNR | BD-rate <br> IV-PSNR | BD-PSNR <br> Y-PSNR | BD-PSNR <br> IV-PSNR |
| :--- | :--- | :--- | :---: | :---: | :---: |

| Fencing | L01 | -16.8\% | -17.8\% | 3.1\% | 2.5\% |
| CBABasketball | L02 | 114.2\% | 174.8\% | -2.5\% | -3.6\% |
| MartialArts | L03 | -61.1\% | --- | 2.6\% | 2.6\% |
| Average |  | 12.1\% | --- | 1.1\% | 0.5\% |

## Remarks:

- RD-curves for B03 are almost flat, and the quality difference should be considered negligible:

|  | B03 |  |  |
| :---: | :---: | :---: | :---: |
| \% | IV-PSNR |  |  |
|  | Anchor BOEPror | sal B0ミ | Delta |
| -0.5\% | 38.46 | 38.26 | -0.20 |
| -0.8\% | 38.44 | 38.24 | -0.20 |
| -1.1\% | 38.36 | 38.16 | -0.20 |
| -0.3\% | 37.82 | 37.62 | -0.19 |
|  | 38.50 | 38.30 | -0.20 |

- efficiency decrease for LO2 is caused by weird ordering of views in the pruning graphs, where neighboring views (v5, v6, v7, and $v 8$ ) are selected to be semi-basic views:

```
000062.260868 info Pruning graph:
000062.260883 info
000062.260885 info
\begin{tabular}{|l|l}
\((\mathrm{v} 9 \mathrm{v} 14)\) \\
\((\mathrm{v} 0 \mathrm{v} 4)\)
\end{tabular}\(<-\mathrm{v}\) <- v8 \(<-\mathrm{v} 13<-\mathrm{v} 12<-\mathrm{v} 11<-\mathrm{v} 10\)
```

## 3 Recommendation

We recommend including the proposed modification in TMIV17.
